Medical School Phase 1 Rotations

Year 1

- Foundation of Medicine
- Genetics and Neoplasia
- Inflammation and Immunity
- Cardiopulmonary
- Gastrointestinal and Nutrition
- Renal and Endocrine
- Reproduction and Sexuality

Year 2

- Musculoskeletal and Soft Tissue
- Brain and Behavior
- Blood and Lymph
- Infectious Diseases
- Integration and Consolidation

Phase 1
New Concepts in Medical Education

- Distance video lectures
- Small group teaching
- Problem – based learning groups
- Early introduction to direct patient care
- Emphasis on history-taking, physical examination and communication skills
- Standardized patients

Family Medicine Residency Programs in Kansas

- Kansas City (KU Medical Center)
- Wichita
  - –Smoky Hill (Salina)
  - –Via Christi
  - –Wesley

Family Medicine Education

- All programs are accredited
- 3 years
- KC has 24 family medicine residents
- Wichita has 96 family medicine residents
- Recognized nationally for clinical education
- Top residents
- Top faculty

The first family medicine residency program in the United States started in 1967.
In what city was it established?

The first family medicine residency program started in 1967.
In what city was it established?

Wichita, Kansas 67214

What does a family medicine resident do?

Why have residency programs?

- Train new doctors for Kansas
- Improves quality of care
- Culture of inquiry
- Attracts other physicians to Kansas

How are we doing?

SPECIAL ARTICLES

Entry of US Medical School Graduates Into Family Medicine Residencies: 2014–2015

Stanley M. Kozakowski, MD; Gerald Fetter Jr, MSA; Ashley Bentley, MBA

BACKGROUND AND OBJECTIVES: This is the 24th national study conducted by the American Academy of Family Physicians (AAFP) that reports annual counts the percentage of graduates from US MD-granting and DO-granting medical schools who entered Accreditation Council for Graduate Medical Education (ACGME)-accredited family medicine residency programs as first-year residents in 2014. Approximately 8.6% of the 22,747 graduates graduating from US MD-granting medical schools between July 2013 and June 2014 entered a family medicine residency. Of the 2,458 graduates of the US MD-granting medical schools who entered a family medicine residency in 2014, 82% graduated from 68 of the 130 schools. These schools having departments or divisions of family medicine produced over a total of 24 graduates entering family medicine. In aggregate, medical schools east of the Mississippi River represent less than a third of all US MD-granting schools but have an aggregate rate of graduates entering family medicine that is two-fold higher than schools to the west of the Mississippi. A ranked factor list of US MD-granting medical schools was developed based on the last 3 years' average percentage of graduates who became family medicine residents, using the 2014 and prior AAFP census data. US MD schools continue to fail to promote a primary care medicine, a key measure of social responsibility as expressed by their graduates or graduates entering into family medicine. DO-granting and international medical school graduates filled the majority of ACGME-accredited family medicine first-year resident positions in 2014.

Fam Med 2015;47(9):729-40.

This is the 24th national study conducted by the American Academy of Family Physicians (AAFP) that reports two perspectives: by the percentage of graduates from Liaison Committee on Medical Education (LCME)-accredited, baccalaureate degree granting, and of American Osteopathic Association (AOA)-accredited, baccalaureate degree granting medical schools, who select Accreditation Council for Graduate Medical Education (ACGME)-accredited family medicine residency programs as first-year residents. Data from the AAFP's annual census of these family medicine residency programs and the LCME Annual Medical School Questionnaire Part II are used to analyze the US medical school origin of each student entering into a family medicine residency as a first-year resident.[1] This annual report is one measure of the effectiveness of medical schools to produce a primary care workforce, a key measure of social responsibility as measured by their production of graduates entering into family medicine. Medical schools that have higher entrance rates into family medicine residencies exhibit "positive deviance" from their peers and can enable others to discover innovative strategies to implement solutions to increase student choice of primary care, particularly family medicine.

Methods

The AAFP conducts an annual online census of all residents in ACGME-accredited family medicine residency programs. This study reports on the data from the 2014 survey. Among the data collected is a list all first-year residents and their medical school, including the month and year of graduation. Residency programs that failed to respond to the initial survey were contacted by email or telephone to ensure a 100% response rate to the

The Social Mission of Medical Education: Ranking the Schools

Fitzhugh Mullan, MD; Candice Chen, MD, MPH; Stephen Petterson, PhD; Gretchen Kolsky, MPH, CHES; and Michael Spagnola, BA

Background: The basic purpose of medical schools is to educate physicians to care for the national population. Fulfilling this goal requires an adequate number of primary care physicians, adequate distribution of physicians to underserved areas, and a sufficient number of minority physicians in the workforce.

Objective: To develop a metric called the social mission score to evaluate medical school output in these 3 dimensions.

Design: Secondary analysis of data from the American Medical Association (AMA) Physician Masterfile and of data on race and ethnicity in medical schools from the Association of American Medical Colleges and the American Association of Colleges of Osteopathic Medicine.

Setting: U.S. medical schools.

Participants: 60 043 physicians in active practice who graduated from medical school between 1999 and 2001.

Measurements: The percentage of graduates who practice primary care, work in health professional shortage areas, and are underrepresented minorities, combined into a composite social mission score.

Results: The contribution of medical schools to the social mission of medical education varied substantially. Three historically black colleges had the highest social mission rankings. Public and community-based medical schools had higher social mission scores than private and non–community-based schools. National Institutes of Health funding was inversely associated with social mission scores. Medical schools in the northeastern United States and in more urban areas were less likely to produce primary care physicians and physicians who practice in underserved areas.

Limitations: The AMA Physician Masterfile has limitations, including specialty self-designation by physicians, inconsistencies in reporting work addresses, and delays in information updates. The public good provided by medical schools may include contributions not reflected in the social mission score. The study was not designed to evaluate quality of care provided by medical school graduates.

Conclusion: Medical schools vary substantially in their contribution to the social mission of medical education. School rankings based on the social mission score differ from those that use research funding and subjective assessments of school reputation. These findings suggest that initiatives at the medical school level could increase the proportion of physicians who practice primary care, work in underserved areas, and are underrepresented minorities.

Medical schools in the United States serve many functions, but one of their most basic purposes is to educate physicians to care for the national population. During the latter half of the 20th century, with federal and state support, medical education expanded to meet population needs (1). However, 3 specific interrelated issues challenged medical educators and policymakers: an insufficient number of primary care physicians, geographic maldistribution of physicians, and the lack of a representative number of racial and ethnic minorities in medical schools and in practice.

As early as the 1950s, commissions concerned with the medical workforce in the United States issued reports that raised these concerns (2–4). These reports helped launch legislation beginning with the Health Professions Educational Assistance Act of 1963 that provided support for expansion of medical education with particular attention to primary care, physician distribution, and educational opportunities for minority medical students. The National Health Service Corps, created in 1970, provided scholarships for students who committed to practice in underserved communities. Of the 28 allopathic medical schools opened with the aid of substantial state and federal support between 1970 and 1982, the Association of American Medical Colleges designated 17 as community-based (Salsberg E. Personal communication).

Nevertheless, problems in these 3 areas remain. Evidence increasingly shows that primary care is associated with improved quality of care and decreased medical costs (5, 6). However, an insufficient number of primary care physicians has hampered efforts to provide expanded health care access in states, such as in Massachusetts (7), and business groups and insurers have begun to speak out about the need for increased access to primary care (8).

Rural communities have a chronic shortage of physicians (9, 10), and federally supported community health centers report major deficits in physician recruitment (11, 12). African-American, Hispanic, and Native-American physicians continue to be severely underrepresented in the U.S. workforce. Underrepresented minorities made up 28% of the general population in 2006 (13) but accounted for only 15% of medical students and 8% of physicians in practice (14). These minority physicians provide a dispro-

Toward Graduate Medical Education (GME) Accountability: Measuring the Outcomes of GME Institutions

Candice Chen, MD, MPH, Stephen Petterson, PhD, Robert L. Phillips, MD, MSPH, Fitzhugh Mullan, MD, Andrew Bazemore, MD, MPH, and Sarah D. O'Donnell, MPH

Abstract

Purpose

Graduate medical education (GME) plays a key role in the U.S. health care workforce, declining its overall size and specialty composition and influencing physician practice locations. Medicare provides nearly $10 billion annually to support GME and faces growing policy maker interest in creating accountability measures. The purpose of this study was to develop and test candidate GME outcome measures related to physician workforce.

Method

The authors performed a secondary analysis of data from the American Medical Association Physician Masterfile, National Provider Identifier file, Medicare claims, and National Health Service Corps, measuring the number and percentage of graduates from 2006 to 2008 practicing in high-need specialties and underserved areas aggregated by their U.S. GME program.

Results

Average overall primary care production rate was 25.2%, for the study period, although this is an overestimate because hospitalists could not be excluded. Of 765 sponsoring institutions, 158 produced no primary care graduates, and 184 produced more than 40%. An average of 27.2% of overall medicine residents were retained in primary care, including hospitalists. Mean general surgery retention was 28.4%. Overall, 4.8% of graduates practiced in rural areas; 186 institutions produced no rural physicians, and 282 institutions produced no Federally Qualified Health Center or Rural Health Clinic physicians.

Conclusions

GME outcomes are measurable for most institutions and training size, specialty, and geographic decisions may significantly. These findings can inform educators and policy makers during a period of increased calls to align the GME system with national health needs.

Graduate Medical Educators (GME) plays a key role in the makeup of the U.S. physician workforce, and it represents the largest public investment in health
