#### KANSAS DEPARTMENT OF REVENUE

#### **PRESENTATION**

#### KANSAS SENATE COMMERCE COMMITTEE

#### **JANUARY 21, 2016**

- I. Short overview of current tax policy
  - We have reduced individual income tax rates by 30% for individuals, families and small business. Current rates are 4.6 for the top rate and 2.7 for the lower rate. These rates are frozen until 2018.
  - 71% of tax savings went to Kansas individuals and families. 29% went to small business.
  - We have the highest Earned Income Tax Credit in our region and one of the highest nationally.
  - We increased the standard deduction for married filing jointly and head of household, the latter benefits single parent households. Approximately 80% of Kansans use the standard deduction now.
  - We have a food sales tax credit.
  - 388,000 of our lowest income Kansans have been removed from the tax rolls, now with a zero tax liability.
  - Sales tax is now 6.5%.

#### II. Trends

- Corporate income tax trends are normal. Fiscal year to date through December we are up 2.6% over estimates.
- **Use Tax receipts** are increasing. Fiscal year to date through December we are up 2.5% over estimates.
- Individual income tax receipts are growing year over year. This is with a further rate reduction in 2015. We would expect now that rates are frozen for a couple of years, to see receipts continue to grow. Low employment is also helpful increasing individual income tax receipts.
  - December appeared to have an anomaly with the December 31<sup>st</sup> payday with some folks not making withholding payments until after the first of the year.
- Sales tax receipts are a challenge right now. Since spring 2015 we have seen a decline in sales tax receipts.

We reviewed 67 of our top sales tax filers, who provide over 50% of our sales tax receipts. In November they were down 4.2% from the previous year.

We also compared our sales tax receipts with other states and it appears that states with significant agriculture and oil industries have experienced declines in sales tax revenue, some much more than Kansas.

In conversations with various economists there seems to be several possible factors:

- Increased savings and paying down debt by folks.
- Increased on line sales
- As mentioned above, states with significant agriculture and oil sectors in their economy are seeing decreased spending
- Increased health care cost reducing discretionary spending

Statistics included in this presentation would not indicate too much "spill-over" of sales in border counties.

#### III. Economic Trends

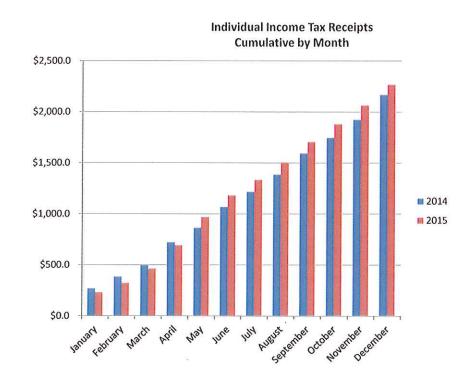

- Unemployment rate is at 4% which is the lowest in 14 years, even with three of our major sectors of the economy struggling.
- We are seeing an increase in in-migration of wealth to the state. When you see the amount and counties benefitting the most you could assume there is a correlation to the small business tax policy. This will be covered more by Michael Austin.
- Positive wage growth partly due to the low unemployment rate.
- Small businesses migrating to Kansas. Besides anecdotal stories we have been able to evaluate Tax Year 2013 returns to find that we had 8,666 first time small business filers bringing \$486.7 million in new income to Kansas. By first time filers, the social security number or name has not previously appeared on a Kansas tax return. We are now working on Tax Year 2014 returns to update this information.

90% of these first time filers had a net income of less than \$25,000.

89% of our overall small business filers have a net income of less than \$50,000 and 5.4% have a net income of more than \$100,000.

# KCHEALTHYKIDS STUDY ON FOOD SALES AND CROSS-BORDER SHOPPING

#### KCHEALTHYKIDS STUDY

- In Kansas, among 105 counties, seventy counties share at least one border with another state."
- The purpose of the study is to estimate the impact of sales tax differentials on food sales in Kansas counties, with particular emphasis on border Kansas counties.
- The study found that food tax rate differentials negatively food consumption; For every 1 unit increase in the tax difference food sales volume decreases by 9.769% per person per year.
  - "On the average, per capita food consumption is \$1,042 per capita, thus for every one percent increase in food tax difference, food consumption drops by about \$101 per person, controlling for other factors."
- There are many issues with the report and it's applications as a policy measure.

#### KCHEALTHYKIDS STUDY

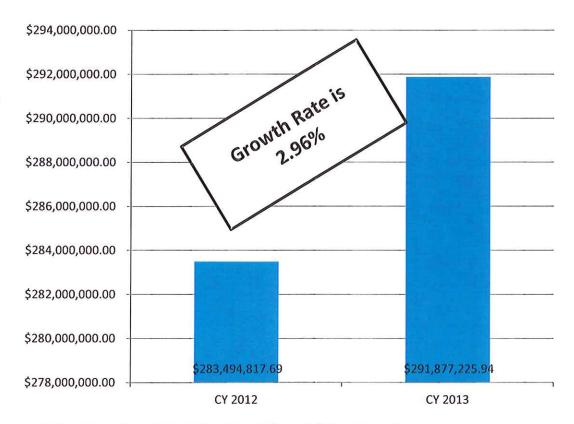

- 1. Counties with a higher sales tax rate may see lower food sales, however that does not mean people are crossing county lines.
  - 1. The study does not suggest causality between local tax rates and food sales
  - 2. The study does not adjust for a "convenience" measure, especially for rural counties
  - 3. Not all groceries are sold under the NAICS 445-Food and Beverage Stores. As an example, Walmart and other large Supermarkets may be considered in NAICS 452 General Merchandise Stores. Ergo the magnitude of the food sales elasticity may be over-stated.
  - 4. The study does not look at food sales over time, and so it may mis-state findings that have been a trend regardless of tax rates.
  - 5. This model also assumes that persons are completely knowledgeable about sales taxes and state/local government decisions about it.
- 2. The study does not prove that lowering food sales tax will reverse "people crossing county lines"
- 3. Nebraska, Oklahoma, and Colorado have had low sales tax on food for decades, collectively. Is it not reasonable to believe that persons have been shopping for groceries in different counties/states due to lower tax rates for decades.
- 4. The study implies that EITC and the food sales tax credit have had no effect.
- 5. The study implies that the low income tax exclusion will have no effect.
- 6. If this study is to be believed as being true, then the effects on food sales lost are very small. The average tax differential is 0.4%. Using their elasticity, that means that loss in food sales is on average \$40.00/per capita/per year.

# State and Local Sales Collections Kansas Grocery Stores

#### **KCHEALTHYKIDS STUDY**

The study does not use food sales tax revenue from the Kansas Department of Revenue

Actual data from KDOR show growth in food sales tax that exceeds inflation (adjusted for sales tax drop)

Source: Kansas Department of Revenue, Office of Policy and Research

#### KCHEALTHYKIDS STUDY

- Policy implications of the study
  - Revenue Neutrality vs Net Economic Good
  - Cheaper Price of one Good vs Lower Income
